Mum Muyassir's Sew Fashion & Fabrics: Capstone Project Report

CC-Hub GATEWAY Program

Digital Marketing Track

Oct 10, 2026

1. Business Overview & the Problem

Mum Muyassir's Sew Fashion & Fabrics is a Nigerian fashion and fabrics SME selling to individual customers, with occasional bulk/wholesale orders. The business relies on WhatsApp, Instagram and Facebook for product discovery, enquiries and order communication. Before this project, customer management was entirely manual:

- Enquiries arrived through several disconnected channels (WhatsApp, Facebook, Instagram), with no central record
- Follow-up depended on memory, so leads were often missed
- Customer details, measurements and order status lived in scattered chats rather than one system
- There was no way to tell a new enquirer from a returning customer, or to measure which marketing activity actually produced a sale

This project builds the digital system to fix each of these, while keeping WhatsApp and social media as the business's real customer-facing channels (the system works behind them, not instead of them).

2. Digital Transformation Overview

The proposed flow connects marketing activity to measurable business outcomes, rather than treating content and operations as separate concerns:

1. **Social Media / WhatsApp**: product discovery and enquiries
2. **Lead Capture**: Google Form behind the WhatsApp/social call-to-action
3. **Central CRM Record**: the enquiry becomes a tracked Lead, linked to a Customer record
4. **Automated Assignment**: lead stage, status and assignment are set automatically on capture

5. **Order Confirmation & Management**: orders are linked to the correct customer and product
6. **Customer Update**: order status and history are kept current and displayed on the dashboard
7. **Marketing & Sales Analytics**: a live dashboard reports leads, customers, orders and revenue

Each stage below is now implemented and tested, not just planned.

3. System Architecture

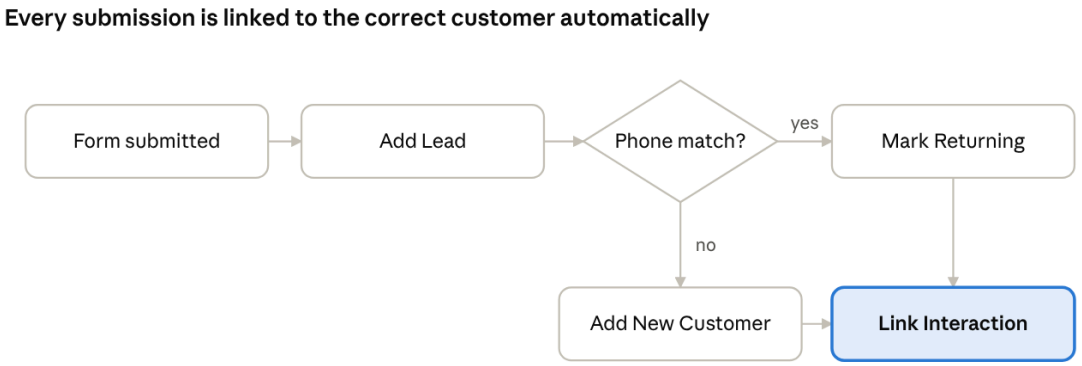

The CRM is a 7-sheet Google Sheets workbook. Every record carries a standardized, self-generating ID (e.g. **LED0001**, **CUST0001**), so sheets can reference each other reliably without manual lookup.

Sheet	Purpose	Key ID
01_LEADS	Captures every enquiry, with stage, status, follow-up date and assignment	LED####
02_CUSTOMERS	Permanent customer record; links to orders and interaction history	CUST####
03_INTERACTIONS	Logs every contact (enquiry, call, follow-up), linked to a Customer ID	INT####
04_PRODUCTS	Product catalogue with retail and wholesale pricing	PRD####
05_ORDERS	Orders linked to a Customer ID and Product ID, with auto-computed price and total	ORD####
06_CAMPAIGNS	Marketing campaign tracking (leads, orders, revenue per campaign)	CAMP####
07_DASHBOARD	Live KPI reporting pulled from the six sheets above	—

The sheets are genuinely linked, not just similarly labelled: Customer ID flows from Leads into Interactions and Orders, Product ID flows from Products into Orders to auto-price each line, and Order data flows back into each Customer record to compute their order count, total spend and last order date.

4. Automation Workflow

Built in Make.com, triggered by Google Form submissions written to a linked response sheet.

Built in Make.com, triggered by Google Form submissions written to a linked response sheet. Every submission creates a Lead immediately. The system then searches Sheet 02_CUSTOMERS by phone number alone, not name, which can be spelled inconsistently. A match marks that customer Returning; no match creates a new Customer record. Either way, the resulting Interaction record is linked with the correct Customer ID, confirmed by testing both paths with repeated and first-time phone numbers.

5. Business Logic Implemented

- **Retail vs. wholesale pricing:** an order's Unit Price is computed automatically from quantity, under 6 units pulls the retail price, 6 or more pulls the wholesale price, looked up directly from 04_PRODUCTS by Product ID. Price can no longer drift from the catalogue.

- **Customer history, computed, not typed:** each customer's Total Orders, Total Spend and Last Order Date are formulas reading from 05_ORDERS, not manually maintained fields; they update the moment a new order is linked to that customer.
- **Returning-customer detection:** implemented by phone number, the one identifier that's reliable across spelling variations in a name. This is covered in detail in the Automation Workflow below.

6. Dashboard & KPIs

All 12 KPI cells are live formulas reading directly from the CRM sheets, nothing on the dashboard is typed in by hand.

KPI	Measures
Total Leads	Every enquiry captured, regardless of stage
Qualified Leads	Leads marked "Qualified"
Converted Leads	Leads marked "Converted" to a customer
Total Customers	Distinct customer records
Total Orders	All orders placed
Completed Orders	Orders marked "Completed"
Total Revenue	Sum of all order totals
Average Order Value	Mean order total
Open Follow-Ups	Leads still awaiting contact
Repeat Customers	Customers flagged "Returning Customer"
Active Products	Products currently in stock/active
Campaigns	Number of campaigns on record

A Marketing Performance table and an Order Performance breakdown (by status: Pending, Confirmed, Processing, Ready, Completed, Cancelled) sit below the main KPI grid. The Marketing Performance figures are labelled as an illustrative example of the metric the system is designed to track, since campaign-level attribution (tagging which campaign produced which lead) is a planned extension (see Limitations below).

7. Results & Expected Business Benefits

This is a tested working demo built with real test submissions, not a live business deployment, the figures below describe what the system is built to deliver, consistent with how the original strategy framed its benefits as expected rather than measured.

With this system in place, Mum Muyassir's Sew Fashion & Fabrics :

- Respond to every enquiry consistently, since nothing depends on memory
- Tell new customers from returning ones automatically, by phone number. This is tested and confirmed correct on both paths
- See each customer's order count, total spend and last order date without manual tallying
- See true KPIs (leads, follow-ups, revenue, repeat-customer rate) on one dashboard, computed live
- Price every order correctly against the catalogue, with no manual entry error

The demonstrated technical foundation (reliable IDs, linked sheets, phone-based customer matching) is what the original strategy's "**attention → enquiries → customers → business value**" chain actually requires to work in practice.

8. Limitations & Future Work

- **Campaign attribution isn't live yet.** Leads aren't currently tagged with which campaign produced them, so Marketing Performance figures are illustrative rather than computed. Adding a "Which campaign?" field to the form and mapping it through would make this real.

- **Marketing Performance table shows one campaign row only** (not yet dynamic for multiple campaigns). It is fine at the current scale, worth revisiting if more campaigns are added.
- **Phone-number matching assumes consistent formatting.** A number entered as 0803… versus +234803… would currently be treated as two different people; a phone-cleaning step would close this gap.
- **Order-item measurements** (gown height/width, palazzo height) are specified in the original design but not yet built into 05_ORDERS sheet.
